Continuation of: Box I.4

As amended in the amendment forms received by the International Preliminary Examining Authority on 20 April 2006, claim 4 sets forth a feature wherein the locking bar, which is normally maintained at a disengagement position where it is disengaged from the winding shaft, is made to engage with the winding shaft by merely rotating the ratchet in one direction around the axis of rotation. However, the feature in question is not set forth in the description of the international application as originally filed. Such being the case, the technical features set forth in claims 4 and 5 go beyond the scope of the disclosures in the international application as originally filed.

Furthermore, although the gear wheel (116), the bushing (112), the washer (140), the slider (144), the holder (170) and the spacer (184) are formed from resin, the definition of the term "surrounded" in the disclosure "the ratchet is surrounded by resin members" in claim 5 is unclear.

As amended under the provisions of PCT Article 19, claim 4 indicates that a locking bar is provided to the ratchet, and claim 5 indicates that the ratchet is surrounded by resin members. However, the features in question are not set forth in the description of the international application as originally filed. Such being the case, the technical features set forth in claims 4 to 6 go beyond the scope of the disclosures in the present international application as originally filed.
